

LifeSaver

A Web Portal

Hackathon : Hack2021
Team Name : Debuggers

Problem Statement

In an emergency situation it is hard to find a bed in hospitals, especially, in the times of the pandemic, we saw how people struggled for ventilators.

Thus, in this hackathon, we would like to focus on how can we best manage this situation

Solution

We debuggers have come up with a solution to the above stated problem.

A web portal which can be used both by the patients and the admin staff at the hospitals. The patients can view available beds in the nearby hospitals, register hospital beds/ ventilators on their way to the hospital in an emergency situation skipping the cumbersome paperwork, and get consultations from the doctors for minor ailments from their home itself.

Features

Register on your way to the hospital to save time and paperwork

The patients could easily look through the nearest hospitals in the website and register a bed on their way to the hospital to avoid lag in time due to formalities and paper work on reaching the hospital.

Check the availability of ventilators and hospital beds

The website enables the patients to view only those hospitals who have beds available. This information is provided by the hospital itself on the admin portal of the website.

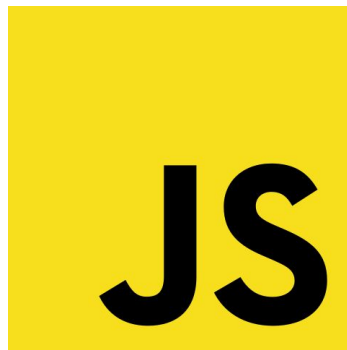

Consult a doctor from your home

With the help of the lifeSaver website there is no need to physically go to the doctor for consultation regarding a minor ailment. You can just log on to the website and your query will be answered by a doctor.

Technologies Used

Thank You!
